IPA vowel chart

< 50% relevant for English

Where symbols appear in pairs, the one to the right represents a rounded vowel.

English vowel orthography

- Most languages that use the Roman alphabet retain the approximate Roman values: $\{a, e, i, o, u\} = [\text{a}, \text{e}, \text{i}, \text{o}, \text{u}]$
- These “international values” are also used by the IPA
- In English orthography, everything is shifted
 - *goose* is not [gos], but [gus]
 - *geese* is not [geis], but [gis]
 - *name* is not [nam], but [nem]
 - *nine* is not [nin], but [nam]

Great Vowel Shift

Great Vowel Shift

(Kip Wheeler)

Schwa

- [ə] always (in English) unstressed, reduced, roughly centered
- Most AE speakers have two reduced vowels, [ə] and [ɪ] (e.g. *Rosa's roses*)
- [ə] vs. [ʌ]
- Unstressed “er” is rhotacized schwa [ɝ]

Tense/lax

- Longer, more peripheral
- Rule of thumb: Roman letters are tense, others lax
 - ɑ e i o u
 - æ ɛ ɪ ɔ ʌ ʊ ə
- Another hint: if it can occur at the end of a monosyllabic (formal English) word, it's tense: *spa, lay, lee, low, loo*
- Tense vowels normally don't precede codas [ŋ] or [ʃ]

Syllable structure

- Nucleus is obligatory (universally)
- Onset & coda are optional (in English)
- Onset & coda can contain only consonants
- Nucleus is usually a vowel, but can be a **syllabic consonant** in some languages

Syllabic consonants

- English: l̩, m̩, n̩
 - One sometimes sees [ɹ̩] instead of [ɹ] or [ɹ̥]
- Always unstressed
e.g. *apple*, *bottle*, *bottom*, *button*, *blossom*
- Typologically, any consonant can be syllabic

Stress

- Marked by ' before the **syllable** (not just the vowel!)
- Always mark stress, even for monosyllables
 - *stub*
 - *syllable*
 - *syllabic*
- Secondary stress (usually unnecessary): ,

Allophonic vowel nasalization in English

- Contextual variants = **allophones** (general phenomenon = **allophony**)
- English vowels nasalized before nasal **codas** ([can_cat.wav](#))
- In some languages, vowel nasalization is contrastive (minimal pair in French?)

Flap

- (Doesn't apply to all English dialects, but is standard in General American)
- *Waiter*, *wader*: neither [t] nor [d], but [ɾ]
- Usually spelled *t(t)* or *d(d)* in English, but often *r* in other languages (cf. Spanish *pero*)
- [ɾ] akin to multiple [ɾ]

Distribution of flap

- “Flap” and “tap” have the same IPA symbol
- [ɾ] whenever /t/ or /d/ is between vowels/approximants and the following syllable is unstressed
- Flapped
 - *butter* [ˈbʊɾɹə] (Praat)
 - *bottle*
 - *fader*
 - *cuddle*
 - *party*
 - *radio*
- Not flapped
 - *ideal*
 - *fades*
 - *candid*

Nasalized flap

- [ɾ̃]
- Whenever /n/ occurs in flapping context in English, e.g.
winner [ˈwɪɾ̃ə] (Praat)

Glottal stop

- /t/ can also be realized as [ʔ], especially before a nasal, e.g.
[ˈbʊʔn]

Aspiration & devoicing in English

- Aspiration
 - A voiceless stop is aspirated (e.g. [p^h]) when initial in a word or stressed syllable (e.g. *tip*, *stack*)
- Devoicing
 - A voiced plosive is optionally devoiced (e.g. [b̥]) utterance-initially

Approximant devoicing in English

- Approximant consonants of English: {j w ɹ l}
 - (ɹ is also an approximant, but irrelevant here)
 - Technically, vowels are also approximants
- When a would-be aspirated stop immediately precedes an approximant consonant, instead of aspiration, the approximant is devoiced, e.g. *play*: [ˈp̚leɪ], not *[ˈp^hleɪ]

tr affrication

- /t/ is usually affricated before /ɹ/ ([Praat tea_tree.wav](#), [trip_tip.wav](#))

Light vs. dark *l*

- /l/ is **dark** (a.k.a. **velarized**) in codas, and **light** elsewhere
([Praat feel_leaf.wav](#))
- Merger with [ou] in some dialects

Word-final stops in English

- Word-finally, voiceless stops are optionally **unreleased** and/or **glottalized**
- IPA for no release: [t̚]
- IPA for simultaneous glottal stop: [t̚ʔ]
- Usually not transcribed, since optional & low-level

English allophony: summary so far

- Aspiration
 - Initial devoicing
 - Approximant devoicing
 - Flapping (including nasal flapping)
 - Affrication of /tɹ/
 - Glottal stop allophone of /t/
 - Vowel nasalization
 - Dark l
-
- **Narrow transcription** should reflect all these, as well as stress & syllabic consonants

Broad(er) vs. narrow(er) transcription

- *plain* /plen/ vs. [ˈpl̥ẽm]
